-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 12 September 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1 and 3-20 is/are pending in the application.
- 4a) Of the above claim(s) 3 and 4 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1 and 5-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
- ☒ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- ☐ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- ☐ Notice of Informal Patent Application
- ☐ Other: _____

Art Unit: 1745

DETAILED ACTION

This Office Action is in response to the communication filed on 9/12/07. Applicant's arguments have been considered, but are not persuasive. Claims 1 and 3-20 are pending. Claims 3 and 4 are withdrawn.

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 9/12/07 has been entered.

Election/Restrictions

Applicant requested nonelected Group II be rejoined with Group I. Group II will be considered for rejoinder only if all claims in elected Group I are directed toward allowable subject matter.

Specification

The amendment filed 8/17/07 is objected to under 35 U.S.C. 132(a) because it introduces new matter into the disclosure. 35 U.S.C. 132(a) states that no amendment shall introduce new matter into the disclosure of the invention. The added material which is not supported by the original disclosure is as follows: "the aspect ratio of the lamellar particle is the ratio of the longest diameter (the length of a portion having the longest diameter of the particle) to the thickness of the lamellar particle".

Applicant is required to cancel the new matter in the reply to this Office Action.

Art Unit: 1745

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 5-14 and 17-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fenton et al., US 6,465,136.

Fenton teaches a composite membrane structure comprising a composite membrane and at least one protective layer disposed adjacent to the composite membrane. The composite membrane is a porous polymeric matrix (porous film) and an ionically conductive solid, noble metal or combination thereof dispersed within the matrix, and preferably, a binder. The binder is an ion exchange polymer. The protective layer comprises binder and ionically conductive solid, hygroscopic fine powder or a combination thereof (abstract). The porous polymeric matrix possesses high porosity and extremely fine pore size. Preferably the matrix has pores possessing a maximum dimension in the range from about 0.025 μm to about 1 μm . (4:66-5:13). The ionically conductive solid and binder are impregnated into the porous polymeric matrix in order to render the interior volume of the membrane occlusive (33-39). The binder is preferably present in the composite membrane and is any chemically and electrochemically stable ion exchange resin or other polymer with high ionic conductivity (6:19-29). The protective layer comprises a binder and hygroscopic fine powder. The fine powders may be silica or titania and have an average particle size less than about 10 μm (6:61-67). The binder employed in the protective layer may be the same as that employed in the composite membrane (6:40-60). The

Art Unit: 1745

matrix has porosity in the range of 40-95%, more preferably 60-90% (5:14-20). The matrix has a thickness of 6-102 μm (4:55-65). The binder and ionically conductive solid employed in the protective layer are the same types of materials as those dispersed within the composite membrane (continuous phase) (6:50-54). Noble metals (inorganic filler) can be used in addition to the ionically conductive solid in the composite membrane (6:7-18). Crosslinkable ion exchange materials are described at column 6, lines 25-29.

Fenton does not explicitly teach fine powders having an aspect ratio of 50 to 2000.

However, the invention as a whole would have been obvious to one having ordinary skill in the art at the time the invention was made because the courts have held that where the only difference between the prior art and the claimed invention was a recitation of relative dimensions (particle size or aspect ratio) of the claimed device (composite membrane) and a device having the claimed relative dimensions would not perform differently than the prior art device, the claimed device was not patentably distinct from the prior art device. See MPEP 2144.04.

Regarding claims 10 and 11, one of skill would have known that the composite membrane with protective layer of Fenton and the ion exchange membrane of the claimed invention would have had similar properties.

*

Claims 15 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fenton et al., US 6,465,136 in view of Roark et al., US 7,001,446.

See discussion of Fenton above regarding claim 1. Fenton does not explicitly teach the fine particles are selected from the materials of pending claim 15.

Art Unit: 1745

However, Roark teaches a protective layer is applied to a membrane to protect the catalyst from the detrimental effects of feedstream and other contaminants that may enter the membrane. Exemplary protective layers include alumina, zirconia and other metal oxides. A protective layer of porous perovskites can be used to protect the membrane from poisoning. In addition, a protective layer comprising a ceramic or other material that absorbs water or hydrocarbons can be provided (9:57-10:16).

Therefore, the invention as a whole would have been obvious to one having ordinary skill in the art at the time the invention was made because one of skill would have been motivated to use the perovskite protective layer material of Roark for the protective layer of Fenton because Fenton teaches useful powders for the protective layer are those which are capable of absorbing water. The protective layer of Fenton decreased the amount of fuel crossover and the protective layer of Roark prevents the feedstream and contaminants from passing through to the membrane. Therefore, one of skill would have been motivated to use the protective layer materials of Roark for the protective layer of Fenton to decrease fuel (feedstream) crossover.

Response to Arguments

Applicant's arguments filed 8/17/07 have been fully considered but they are not persuasive.

Applicant argues Fenton fails to teach or suggest an ion exchange membrane comprising a crosslinked ion exchange polymer. However, Fenton teaches crosslinkable ion exchange materials at column 6, lines 25-29. Perfluorosulfonic acid (Nafion), is a crosslinkable monomer.

Applicant argues Fenton does not teach or suggest a lamellar particle having an aspect ratio of 50-2000. However, the invention would have been obvious to one of skill in the art

Art Unit: 1745

because the courts have held that where the only difference between the prior art and the claimed invention was a recitation of relative dimensions (particle size or aspect ratio) of the claimed device (composite membrane) and a device having the claimed relative dimensions would not perform differently than the prior art device, the claimed device was not patentably distinct from the prior art device. See MPEP 2144.04. Applicant asserts unexpected results are shown in the Examples of the specification. However, the Examples are not representative of the Fenton reference. Unexpected results must distinguish the claimed invention over *the prior art of record*. Furthermore, the Examples are not commensurate in scope with the claimed invention because at least claim 1 does not require a fuel cell wherein methanol is supplied as an anode reactant gas.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tracy Dove whose telephone number is 571-272-1285. The examiner can normally be reached on Monday-Thursday (9:00-7:30).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Pat Ryan can be reached on 571-272-1292. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
